What do you see? An o

If you answered the lat

Oversize is often a sym
confinement. And with
the collar zone.

Was it too much stemming length? Or the wrong type of stemming. Either way, the result was the same i.e The energy needed to break the rock never made it to the right place.

The good news? There are tools and techniques that can dramatically improve energy distribution and fragmentation performance.

Cue Blastbags and blasting with airdecks.

This approach helped one mine in West Africa reduce oversize and improve blast outcomes significantly.

Discover the full case study below:

What's really going on?

If you've ever asked yourself how a borehole camera offers a clear view of what's happening inside the hole — from collar to toe — you know the answer.

Using a tethered probe with a 10-inch, anti-glare display, you can see what's really going on.

No assumptions. No guesswork.

[#Boreholecamera](#) [#Drilling](#) [#Miningtechnology](#)

MTi's borehole camera offers a clear view of what's happening inside the hole — from collar to toe — you know the answer.

Full 360° view via a 10-inch, anti-glare display.

Another day, another bench to conquer!

Blasters, what are the non-negotiables in your kit before heading to site? Tell us about your must-haves — the can't-live-without tools you bring to the bench.

And yes, we'll allow coffee.

Humble in size but an important mechanical device used in underground mining support. By reducing material movement in the hole with the tight seal it forms, the Mitiplug ensures that product does not slump or fall out before the detonator is set off.

Where it helps:

- Charge containment -holds explosive material in place and prevents stemming mixing
- Safety- by improving confinement, air blast and fly rock risk is reduced
