

This project has retired. For details please refer to its [Attic page](#).

HTML

Class Name : `org.apache.jetspeed.portal.portlets.FileServerPortlet`

Description

Present HTML in a portlet.

Why use a HTML portlet instead of a WebPagePortlet?

- HTML is a static
- Not a complete HTML document, i.e. <HEAD> is not in file
- HTML file does not have to be visible to the Web Server
- Specific task can not be achieved with WebPagePortlet
- Desired portlet is just an image, like JPEG or SVG

Supported Media Types

Description of Media Types.

- html

Element: parameter

Parameter that control the how the web page is converted into a portlet.

This element is optional.

Parameters common to many portlets.

Element: url

Name of HTML file. This must include the path relative to <jetspeed_home>

This element is **required**.

Example of use

Portlet Entry

```
<portlet-entry name="Logo" hidden="false" type="ref"
  parent="HTML" application="false">
  <meta-info>
    <title>Logo</title>
    <description>Example of HTML portlet</description>
  </meta-info>
  <url>/Logo.html</url>
</portlet-entry>
```

<jetspeed_home>/Logo.html

```
<!--
  Portlet contains the Jetspeed logo. This could be a
  link to SVG graphic trending the corporate stock over the
  last 30 days.
-->
<a href="http://portals.apache.org/jetspeed-1">
  
</a>
```
