Last Updated on November 11, 2021

When users successfully log in, log out or reset their password on your site, you can set a page or custom URL they should be redirected to. If you leave the “Custom URL” field empty the redirection will fall back to the selected page.

Log out

Member Directory

Custom URL Here

Select the page users will be redirected to after logout. To redirect to a custom URL instead of a selected page, enter the URL in input field directly above this description. Leave the "custom URL" field empty to fallback to the selected page.

Login

WordPress Dashboard

Custom URL Here

Select the page or custom URL users will be redirected to after login. To redirect to a custom URL instead of a selected page, enter the URL in input field directly above this description. Leave the "custom URL" field empty to fallback to the selected page.

Password Reset

Default..

Custom URL Here

Select the page or custom URL users will be redirected to after they successfully reset or change their password. To redirect to a custom URL instead of a selected page, enter the URL in input field directly above this description. Leave the "custom URL" field empty to fallback to the selected page.

Save Changes

For Login redirection, there is the “Currently viewed page” option to redirect users to the page they are currently viewing after login. And “Previous/Referrer page” to redirect users to the referrer page or previous page they were on after login.

Custom Redirections

You can also set custom redirect per login and registration shortcodes via the `redirect` attribute.

For example, a custom login page with the shortcode below will redirect users to the URL <https://xyz.com/welcome> after they are logged in.

```
[profilepress-login id="2" redirect="https://xyz.com/welcome"]
```

Similarly, a registration page with the shortcode below will log users in and redirect them to the <https://xyz.com/welcome> after they successfully create an account.

```
[profilepress-registration redirect="https://xyz.com/welcome"]
```

To redirect users to the previous page they were on after they are auto-logged-in, replace the “redirect” attribute with “previous_page” like this:

```
[profilepress-registration redirect="previous_page"]
```

If you don’t want users to be logged in before the redirect happens, change “redirect” to “no-login-redirect” like so:

```
[profilepress-registration no-login-redirect="https://xyz.com/w
```

How about if you wish to redirect unregistered or non-logged-in users to your website login page when they try to access a post or page; use the following shortcode on the said post or page.

```
[pp-redirect-non-logged-in-users]
```

If you want them redirected to a custom URL, use the shortcode like so:

```
[pp-redirect-non-logged-in-users url="http://yourwebsite.com/cu
```

To redirect only logged in users to a custom URL, use the following shortcode:

```
[pp-redirect-logged-in-users url="http://yourwebsite.com/custom
```

Remember, if the user isn't logged in, no redirection will occur. And omitting the `url` attribute will cause the user to be redirected to the login page.
